## TITLE OF THE INVENTION

TETRAHYDRO-4H-PYRIDO[1,2-a]PYRIMIDINES AND RELATED COMPOUNDS  
USEFUL AS HIV INTEGRASE INHIBITORS

## 5 FIELD OF THE INVENTION

The present invention is directed to tetrahydro-4H-pyrido[1,2-a]pyrimidines, related compounds, and pharmaceutically acceptable salts thereof, their synthesis, and their use as inhibitors of the HIV integrase enzyme. The compounds and pharmaceutically acceptable salts thereof of the present invention are useful for preventing or treating infection by HIV and  
10 for treating or delaying the onset of AIDS.

## BACKGROUND OF THE INVENTION

A retrovirus designated human immunodeficiency virus (HIV) is the etiological agent of the complex disease that includes progressive destruction of the immune  
15 system (acquired immune deficiency syndrome; AIDS) and degeneration of the central and peripheral nervous system. This virus was previously known as LAV, HTLV-III, or ARV. A common feature of retrovirus replication is the insertion by virally-encoded integrase of proviral DNA into the host cell genome, a required step in HIV replication in human T-lymphoid and monocytoid cells. Integration is believed to be mediated by integrase in three  
20 steps: assembly of a stable nucleoprotein complex with viral DNA sequences; cleavage of two nucleotides from the 3' termini of the linear proviral DNA; covalent joining of the recessed 3' OH termini of the proviral DNA at a staggered cut made at the host target site. The fourth step in the process, repair synthesis of the resultant gap, may be accomplished by cellular enzymes.

25 Nucleotide sequencing of HIV shows the presence of a pol gene in one open reading frame [Ratner, L. et al., Nature, 313, 277(1985)]. Amino acid sequence homology provides evidence that the pol sequence encodes reverse transcriptase, integrase and an HIV protease [Toh, H. et al., EMBO J. 4, 1267 (1985); Power, M.D. et al., Science, 231, 1567 (1986); Pearl, L.H. et al., Nature, 329, 351 (1987)]. All three enzymes have been shown to  
30 be essential for the replication of HIV.

It is known that some antiviral compounds which act as inhibitors of HIV replication are effective agents in the treatment of AIDS and similar diseases, including reverse transcriptase inhibitors such as azidothymidine (AZT) and efavirenz and protease inhibitors such as indinavir and nelfinavir. The compounds of this invention are inhibitors of  
35 HIV integrase and inhibitors of HIV replication. The inhibition of integrase in vitro and HIV

replication in cells is a direct result of inhibiting the strand transfer reaction catalyzed by the recombinant integrase in vitro in HIV infected cells. The particular advantage of the present invention is highly specific inhibition of HIV integrase and HIV replication.

## 5 SUMMARY OF THE INVENTION

The N-substituted hydroxypyrimidinone compounds of the present invention may also occur as tautomers thereof, such as the following tautomer of a compound of Formula I:

It is understood that the present invention includes all tautomers of the hydroxypyrimidinone compounds of Formula I (or II), both singly and in mixtures.

The compounds of the present inventions are useful in the inhibition of HIV integrase, the prevention or treatment of infection by human immunodeficiency virus (HIV) and the prevention, treatment or the delay in the onset of consequent pathological conditions such as AIDS. Preventing AIDS, treating AIDS, delaying the onset of AIDS, or preventing or treating infection by HIV is defined as including, but not limited to, treatment of a wide range of states of HIV infection: AIDS, ARC (AIDS related complex), both symptomatic and asymptomatic, and actual or potential exposure to HIV. For example, the compounds of this invention are useful in

treating infection by HIV after suspected past exposure to HIV by such means as blood transfusion, exchange of body fluids, bites, accidental needle stick, or exposure to patient blood during surgery.

Compounds representative of the present invention have been tested for inhibition  
5 in an assay for the strand transfer activity of integrase. The assay is conducted in the manner described in WO 02/30930. The assay is also in accordance with Wolfe, A.L. et al., *J. Virol.* 1996, 70: 1424-1432, for recombinant integrase, except that: (i) the assay uses preassembled integrase strand transfer complexes; (ii) the strand transfer reaction is performed in the presence of inhibitor in 2.5 mM MgCl<sub>2</sub> using 0.5 to 5 nM of a 3' FITC labeled target DNA substrate, and  
10 (iii) strand transfer products are detected using an alkaline phosphatase conjugated anti-FITC antibody and a chemiluminescent alkaline phosphatase substrate. Representative compounds of the present invention exhibit inhibition of strand transfer activity in this assay. For example, the compounds set forth in Table 1 below were tested in the integrase assay and demonstrated IC<sub>50</sub>'s of about 5 micromolar or less. Further description on conducting the assay using preassembled  
15 complexes is found in Hazuda et al., *J. Virol.* 1997, 71: 7005-7011; Hazuda et al., *Drug Design and Discovery* 1997, 15: 17-24; and Hazuda et al., *Science* 2000, 287: 646-650.

Certain compounds representative of the present invention have also been tested in an assay for inhibition of acute HIV infection of T-lymphoid cells, conducted in accordance with Vacca, J.P. et al., *Proc. Natl. Acad. Sci. USA* 1994, 91: 4096. These compounds --  
20 including the compounds set forth below in Table 1 -- demonstrated IC<sub>95</sub>'s of about 20 micromolar or less.

The compounds of the present invention can also act as inhibitors of HIV ribonuclease H (RNase H). The human immunodeficiency virus type 1 (HIV-1) reverse transcriptase (RT) catalyzes the conversion of genomic RNA into double-stranded proviral DNA  
25 after cell entry, utilizing the RNA- and DNA-dependent polymerase and RNase H activities of the enzyme. HIV-1 RT is an asymmetric dimer consisting of p66 and p51 polypeptides. The catalytic activities of RT are conducted at discrete sites in the p66 subunit; i.e., the N terminus of p66 catalyzes the RNA- and DNA-dependent DNA polymerase activity, and the p15 domain at the C terminus catalyzes RNase H activity. RNase H is required to cleave the RNA strand of the  
30 RNA:DNA heteroduplex intermediates in reverse transcription. The compounds of the present invention can selectively bind to and inhibit the RNase H domain of HIV-1 RT. The RNase H inhibition activity of the compounds can be measured using suitable assays known in the art, such as the assay described in Shaw-Reid et al., *J. Biol. Chem.* 2003, 278 (5): 2777-2780. Accordingly, the present invention includes a method of inhibiting HIV RNase H in a subject in  
35 need of such inhibition which comprises administering to the subject an effective amount of a

compound of the invention. The present invention further includes a compound of the present invention (i) for use in, (ii) for use as a medicament for, or (iii) for use in the preparation of a medicament for inhibiting HIV RNase H.

The compounds of the present invention may be administered in the form of pharmaceutically acceptable salts. The term "pharmaceutically acceptable salt" refers to a salt which possesses the effectiveness of the parent compound and which is not biologically or otherwise undesirable (e.g., is neither toxic nor otherwise deleterious to the recipient thereof). Suitable salts include acid addition salts which may, for example, be formed by mixing a solution of the compound of the present invention with a solution of a pharmaceutically acceptable acid such as hydrochloric acid, sulfuric acid, acetic acid, trifluoroacetic acid, or benzoic acid. When the compounds of the invention carry an acidic moiety, suitable pharmaceutically acceptable salts thereof can include alkali metal salts (e.g., sodium or potassium salts), alkaline earth metal salts (e.g., calcium or magnesium salts), and salts formed with suitable organic ligands such as quaternary ammonium salts. Also, in the case of an acid (-COOH) or alcohol group being present, pharmaceutically acceptable esters can be employed to modify the solubility or hydrolysis characteristics of the compound.

For the purpose of inhibiting HIV integrase or HIV RNase H, preventing or treating HIV infection or preventing, treating or delaying the onset of AIDS, the compounds of the present invention may be administered orally, parenterally (including subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques), by inhalation spray, or rectally, in the form of a unit dosage of a pharmaceutical composition containing a therapeutically effective amount of the compound and conventional non-toxic pharmaceutically-acceptable carriers, adjuvants and vehicles.

The term "administration" and variants thereof (e.g., "administering" a compound) in reference to a compound of the invention mean providing the compound or a prodrug of the compound to the individual in need of treatment. When a compound of the invention or a prodrug thereof is provided in combination with one or more other active agents (e.g., antiviral agents useful for treating HIV infection or AIDS), "administration" and its variants are each understood to include concurrent and sequential provision of the compound or prodrug and other agents.

As used herein, the term "composition" is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combining the specified ingredients in the specified amounts.

By "pharmaceutically acceptable" is meant that the ingredients of the pharmaceutical composition must be compatible with each other and not deleterious to the recipient thereof.

The term "subject" (alternatively referred to herein as "patient") as used herein refers to an animal, preferably a mammal, most preferably a human, who has been the object of treatment, observation or experiment.

The term "therapeutically effective amount" as used herein means that amount of active compound or pharmaceutical agent that elicits the biological or medicinal response in a tissue, system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation or prophylaxis of the symptoms of the disease or condition being treated or prevented. The term also includes herein the amount of active compound sufficient to inhibit HIV integrase and/or RNase H and thereby elicit the response being sought. When the active compound (i.e., active ingredient) is administered as the salt, references to the amount of active ingredient are to the free acid or free base form of the compound.

The pharmaceutical compositions may be in the form of orally-administrable suspensions or tablets or capsules, nasal sprays, sterile injectible preparations, for example, as sterile injectible aqueous or oleagenous suspensions or suppositories. These compositions can be prepared by methods and contain excipients which are well known in the art. Suitable methods and ingredients are described in Remington's Pharmaceutical Sciences, 18<sup>th</sup> edition, edited by A. R. Gennaro, Mack Publishing Co., 1990, which is herein incorporated by reference in its entirety.

The compounds of this invention can be administered orally in a dosage range of 0.001 to 1000 mg/kg of mammal (e.g., human) body weight per day in a single dose or in divided doses. One preferred dosage range is 0.01 to 500 mg/kg body weight per day orally in a single dose or in divided doses. Another preferred dosage range is 0.1 to 100 mg/kg body weight per day orally in single or divided doses. For oral administration, the compositions can be provided in the form of tablets or capsules containing 1.0 to 500 milligrams of the active ingredient, particularly 1, 5, 10, 15, 20, 25, 50, 75, 100, 150, 200, 250, 300, 400, and 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the patient to be treated. The specific dose level and frequency of dosage for any particular patient may be varied and will depend upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of that compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular condition, and the host undergoing therapy.

As noted above, the present invention is also directed to use of the HIV integrase inhibitor compounds of the present invention with one or more agents useful in the treatment of HIV infection or AIDS. For example, the compounds of this invention may be effectively administered, whether at periods of pre-exposure and/or post-exposure, in combination with effective amounts of one or more HIV/AIDS antivirals, immunomodulators, anti-infectives, or vaccines useful for treating HIV infection or AIDS, such as those disclosed in Table 1 of WO 01/38332 or in the Table in WO 02/30930, both documents being herein incorporated by reference in their entireties. It will be understood that the scope of combinations of the compounds of this invention with HIV/AIDS antivirals, immunomodulators, anti-infectives or vaccines is not limited to the list in the above-referenced Tables in WO 01/38332 and WO 02/30930, but includes in principle any combination with any pharmaceutical composition useful for the treatment of AIDS. The HIV/AIDS antivirals and other agents will typically be employed in these combinations in their conventional dosage ranges and regimens as reported in the art, including, for example, the dosages described in the Physicians' Desk Reference, 57<sup>th</sup> edition, Thomson PDR, 2003. The dosage ranges for a compound of the invention in these combinations are the same as those set forth above.

The compounds of the present invention can be prepared by coupling the appropriate amines with suitable substituted alkyl 3-hydroxy-4-oxo-6,7,8,9-tetrahydro-4H-pyrido[1,2-a] pyrimidine -2-carboxylate (or carboxylic acids or halides) or alkyl 3-hydroxy-4-oxo-4,6,7,8-tetrahydropyrrolo[1,2-a]pyrimidine-2-carboxylate (or carboxylic acids or halides) or alkyl 3-hydroxy-4-oxo-4,6,7,8,9,10-hexahydropyrimido[1,2-a]azepine-2-carboxylate (or carboxylic acids or halides) or alkyl 3-hydroxy-4-oxo-6,7,8,9,10,11-hexahydro-4H-pyrimido[1,2-a]azepine-2-carboxylate (or carboxylic acids or halides), as represented by Scheme 1.

Scheme 1

Methods for coupling carboxylic acid derivatives with amines to form carboxamides are well known in the art. Suitable methods are described, for example, in Jerry March, Advanced Organic Chemistry, 3rd edition, John Wiley & Sons, 1985, pp. 370-376. Amines of formula 1-2 can be prepared using the methods described in Richard Larock, Comprehensive Organic Transformations, VCH Publishers Inc, 1989, pp 385-438, or routine variations thereof.

Scheme A depicts a general synthesis of carboxamides A-5. The methyl ester A-4 can be reacted with an amine 1-2 in solvents like DMF, methanol, ethanol, toluene, NMP at the appropriate temperature (e.g., from 20 to 150°C) to give the final compound A-5. Methyl ester A-4 can be synthesized by one of three synthetic routes. In the first route, amidine hydrochloride A-1a (sX=H; sY=H) can be reacted with dimethyl 2-(benzyloxy)-3-oxosuccinate in the presence of a base to afford the protected methyl ester intermediate A-2, which can be readily deprotected to afford the methyl ester A-4. In a second route, amidoxine A-1b (sX=OH; sY=H), obtained in three steps from tert-butyl benzyloxycarbamate, can be reacted with DMAD to afford the cyclic intermediate A-3a, which can be rearranged by heating in an appropriate solvent (e.g., xylene) to afford the methyl ester A-5. In a third route, amidoxyme A-1c (sX=H; sY=OH) can be reacted with DMAD in an appropriate solvent (e.g., acetonitrile) to afford the intermediate A3-b, which can be rearranged to the methyl ester A-4 by heating in an appropriate solvent (e.g., xylene). All three of these routes can be applied to amidines and amidoxymes containing ring substituents. Scheme A is exemplified in Example 1.

Scheme A

Scheme B shows a method for preparing compounds of the present invention that contain an amine, ether, thioether, sulfoxide or sulfone group at the 9-position of the 3-hydroxy-4-oxo-6,7,8,9-tetrahydro-4H-pyrido[1,2-a]pyrimidine-2-carboxamide core. The bromo derivative **B-1** can be obtained from methyl ester **A-4** by first protecting the hydroxy group on **A-4** with a suitable protective group (e.g., conversion to a benzoate or pivalate or to benzyloxy) and then contacting the protected **A-4** with a brominating agent (e.g., NBS). The bromo derivative **B-1** can then be treated with a nucleophile ("Nu"; e.g. an amine, thiol or alcoholate) to afford with or without isolation the methyl ester intermediate **B-2**, that is reacted with the desired amine to give the final product **B-3**. If the nucleophile is a thiol or contains an oxidizable sulfur, an oxidation step to obtain the sulfoxide or sulfone can be included in the scheme. If the nucleophile contains an ester, the ester can be converted to an amide by routine chemistry after the synthesis of **B-3**. Scheme B is exemplified in Example 2.

Scheme B

- Scheme C depicts a general synthesis of derivatives C-3 or C-4 containing an aliphatic ring substituent such as amide, sulfonamide, sulfonylurea, carbamate, or urea. The bromo derivative B-1 can be treated with benzylamine C-1 and then hydrogenated or reacted directly with amine C-1a to give intermediate C-2, which can then be treated with amine 1-2, with or without isolation, and then coupled with a carboxylic acid or reacted with a carbonyl chloride (or sulfonyl chloride or sulfamoyl chloride) or isocyanate to afford the final product C-3. If C-3 contains R<sup>s4</sup> = R<sup>s3</sup>O(CO)CO, it can be further reacted with a nucleophile such as an amine to afford the product C-4. Scheme C is exemplified in Examples 3, 4 and 6. The last two steps can be reversed.

Scheme C

- Scheme D shows the synthesis of homochiral compounds **C-3**, **C3a,b**, and **C-4**. The bromo derivative **B-1** is displaced with chiral amines **D-1** to give a mixture of diastereoisomers, with subsequent or simultaneous removal of the protecting group. The amino group at the 9-position is reductively alkylated with aldehydes or ketones **D-2** to afford the intermediate **D-3**. The mixture of diastereoisomers can be separated by crystallization or chromatography to give the single diastereoisomers **D-3a,b**.  $\text{R}^{\text{s}6}$  can be removed by hydrogenation to afford the homochiral **C-2a,b** intermediate. A subsequent reaction with amine **1-2** and coupling with carboxylic acid or treatment with carbonyl chloride (or sulfonyl chloride or sulfamoyl chloride) or isocyanate affords the final homochiral product **C-3a,b**. As in the case of the racemic compounds **C-3** in Scheme C, an additional step can be performed to produce homochiral **C-4** compounds. Scheme D is exemplified in Examples 5 and 7.

The following procedure is an alternative route for the synthesis of methyl 3-hydroxy-4-oxo-6,7,8,9-tetrahydro-4H-pyrido[1,2-a]pyrimidine-2-carboxylate

After stirring for an hour the cold bath was removed, and stirring was continued for an additional hour. The reaction was quenched at 0°C by pouring into cold 1N aq HCl, and the aqueous phase was extracted with EtOAc; the organic layer was washed with brine, dried and concentrated to give a crude that was used without further purification.

Commercially available 2-iminopiperidine hydrochloride (1.5 eq) was added at room temperature to a solution of oxosuccinate prepared in Step 1b (1 eq) in MeOH. After  
5 dropwise addition of neat DBU (4.5 eq), the reaction mixture was stirred for 2 days. Evaporation of the solvent gave a residue that was taken into EtOAc and washed with 1N HCl and brine; the organic layer was dried on Na<sub>2</sub>SO<sub>4</sub> and the solvent removed. The crude was used without further purification.

Methyl chlorooxoacetate (2-6 eq.) and *N*-ethyl-diisopropylamine (4 eq.) were added to a solution of the ammonium trifluoroacetate compound of Step 8 in chloroform. The mixture was stirred at room temperature for 1 hour. The solvent was removed under reduced pressure and the residue dissolved in a 2 M solution of dimethylamine in methanol was stirred at room temperature for 6 hours. The solvent was removed under reduced pressure and the residue dissolved in dichloromethane was washed with 1 M HCl in water. The organic phase was dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and the solvent removed under reduced pressure. The title product was isolated by preparative RP-HPLC, using water (0.1% TFA) and acetonitrile (0.1% TFA) as eluents (column: C18). The pooled product fractions were lyophilized to afford the title product with an enantiomeric excess of 99.5% (e.e. determined by Chiral HPLC Chiralpak AD, mobile phase 0.2% TFA *n*-Hex/0.2% TFA ethanol with 3% methanol). An amorphous potassium salt of the title compound was obtained by treating the compound dissolved in acetonitrile with aqueous KOH and then freeze drying.

To a solution of acid **12** (122 mg) in THF (3 mL) was added ethyl chloroformate (92 µl) at 0-5 °C. Then, 4-NMM (106 µl) was slowly added to the reaction mixture at 0-5 °C. The reaction mixture was aged at the same temperature for 2 h. The pyrimidine hydrochloride salt **11** (79.4 mg) was added as a solid to the mixed-anhydride solution at 0-5 °C, and aged at the same temperature for 5 h, and then at 5-10 °C for another 2 h (100% conversion by HPLC).

Dimethylamine aqueous (40%, 158  $\mu$ L) was added to the reaction mixture, and the mixture aged at 10-15 °C for 1 h, wherein the reaction was monitored by HPLC to assure complete conversion. The reaction mixture was acidified by 2 N HCl to adjust to pH = 3-4 at 5-15 °C. EtOAc (6 mL) and brine (2 mL) were added, respectively. After phase cut, the organic layer was washed with 1 N HCl (2 mL), brine (2 x 2 mL). The organic layer was concentrated to a total volume of 1 mL. Hexane (5 mL) was slowly added over 0.5 h. The resulting slurry was aged at 0-5 °C for 1 h. The crystalline solid was filtered off, washed with hexane/EtOAc (5: 1), MTBE, dried under vacuum with nitrogen sweep to give the title compound **14** (75.6 mg, 82%). <sup>1</sup>H NMR (CDCl<sub>3</sub>, 400 MHz)  $\delta$ : 12.13 (s, 1 H), 9.41 (br s, 1 H), 7.38 (dd,  $J$  = 8.5, 5.4 Hz, 2 H), 7.00 (t,  $J$  = 8.5 Hz, 2 H), 5.40 (br s, 1 H), 5.29 (dd,  $J$  = 14.5, 6.0 Hz, 1 H), 4.60 (dd,  $J$  = 14.5, 6.6 Hz, 1 H), 4.52 (dd,  $J$  = 14.5, 6.3 Hz, 1 H), 3.35 (dd,  $J$  = 14.5, 11.6 Hz, 1 H), 3.04 (s, 3 H), 3.01 (s, 3 H), 2.98 (s, 3 H), 2.23-2.12 (m, 3 H), 1.95-1.81 (m, 2 H), 1.58-1.49 (m, 1 H).
